Cover: Locations of Automatic Weather Station units operating in the Antarctic for 1992.

1. INTRODUCTION

A network of automatic weather station (AWS) units is deployed to collect Antarctic surface weather observations in support of specific meteorological research projects as well as operational activities at McMurdo. The 1992 network consisted of 38 installed AWS units providing observations on the Ross Ice Shelf, east of the Transantarctic Mountains and north of McMurdo to the Adelie Coast, along the Antarctic Peninsula and climatological locations such as the South Pole. Each unit measures air temperature, wind speed, and wind direction normally at the top of the unit's tower at a nominal height of three meters and air pressure at the electronics enclosure (Figure 1). Some AWS units also measure the relative humidity at three meters and vertical air temperature difference between 0.5 and 3 meters. Measurement heights relative to the actual surface at the site are nominal due to snow accumulation around the AWS unit.

2. DATA TRANSMISSION

The transmitted AWS data are received and stored by the ARGOS data collection system on the NOAA series of polar orbiting satellites. The data are retransmitted by the satellite for reception by a local user terminal (LUT) as at McMurdo, Antarctica. The data are processed into scientific units and are available for local use. The complete data set is received monthly at Madison, Wisconsin, from Service ARGOS, Toulouse, France, for processing and distribution to the users.

3. AWS IDENTIFICATION AND LOCATION

Site location is defined by the latitude and longitude which is determined by various methods: sun shots, angles to geographical features, aircraft data, ice breaker data, the platform location system of Service ARGOS, and the Global Positioning System. AWS elevation is obtained by barometry and should be correct to within +/- 5 meters. Site names were introduced for convenience. Table 3.1 lists the site name, ARGOS identification number, latitude, longitude, elevation, start date for the site, and the WMO number for the site. Figures 2, 3, and 4 show the locations of the AWS units in the Antarctic for 1992.

The ARGOS identification number (ID) is used to identify the data sets distributed to the users. AWS units are sometimes moved from one location to another, and as a result, the ID at a given site may change from year to year. Table 3.2 lists the site name with the ARGOS ID, the site start date, and the ID start and stop dates.

Figure 1. Layout of the AWS unit used in the Antarctic. The installed AWS unit has a 3-meter tower with a horizontal boom supporting the antenna, aerovane for measuring wind speed and direction, air temperature resistance thermometer, upper thermopile for measuring vertical air temperature difference, and the relative humidity sensor. The electronics enclosure is mounted at the mid point of the tower. The gel cell batteries are placed at the tower base. The solar panel, located near the tower top, faces north.

Table 3.1

AWS site name, geographic location and elevation, site start date, and WMO number for 1992.

4. AWS DATA SUMMARIES

The data received by the University of Wisconsin, Department of Atmospheric and Oceanic Sciences, contain all the information received by the ARGOS system including duplicate and erroneous transmissions. Invalid data are eliminated during a quality check and the valid data are converted to scientific units producing the complete data set. Data selected at three hourly intervals, plus or minus one hour, produce a three hourly data set for each AWS unit month. Section 6.1, AWS Performance, provides some explanations for missing and invalid data.

The three hourly data sets presented here are for survey purposes only. Use of the 1992 Antarctic AWS data for publication should acknowledge the support of NSF-DPP Grants 86-06385 and 88-18171 and 90-15586 or reference this publication.

4.1 Monthly Data Summaries

The monthly summaries consist of the monthly means, from the three hourly data set, and the extremes, from the complete data set. For monthly values to be included, 25% of the three hourly observations must be available. Months and/or values with an asterisk beside them indicate 50% or less of the month had reported data. This occurs most often when a station is started or stopped in the middle of the month. This can cause a bias in the monthly mean, especially during seasons when parameters such as temperature change rapidly. Annual means are calculated only when twelve months of data are available. The data are presented in the same order as the sites listed in Table 3.1. Definitions of the monthly data summary headings are listed below.

Heading	Definition
Mean air temperature, °C.	Mean value for the month.
Maximum air temperature, °C.	Maximum value for the month.
Minimum air temperature, °C.	Minimum value for the month.
Mean wind speed, m/s.	Mean value for the month.
Resultant wind speed, dir/vv.	Resultant speed and direction for the month.
Constancy.	Ratio of the monthly resultant to the monthly mean wind speed.
Maximum wind speed, dir/vv.	Maximum wind speed and direction for the month.
Mean air pressure, mb.	Mean value for the month.
Maximum air pressure, mb.	Maximum value for the month.
Minimum air pressure, mb.	Minimum value for the month.

Mon	Mean Air Temp °C	% Of Month Data Absent	Max Air Temp °C	Min Air Temp °C	Mean Wind Speed (m/s)	% Of Month Data Absent	Resultant Wind (dir vv)	Con	Max Wind Speed (dir vv)	Mean Air Press (mb)	% Of Month Data Absent	Max Air Press (mb)	Min Air Press (mb)

4.2 Three Hourly Data Summaries

The data set for each AWS unit for the month is scanned to pick out the nearest observation within one hour of the GMT hours 00, 03, 06, 09, 12, 15, 18, and 21 to produce the three hourly data set. If valid data are not available within the three hourly time interval, then an "X" is entered to indicate missing data. The means, standard deviations, resultant wind speed and direction, the distribution of temperature, and wind speed with wind direction are determined from the three hourly observations and are presented as a monthly summary at the bottom of each page. A wind direction value of zero indicates a wind speed less than 0.50 m/s. North is indicated by a value of 360 degrees. The maximum and minimum values are taken from the complete data set, not the three hourly data set. The appropriate monthly data from the three hourly data set are used for the monthly summaries presented in 4.1. In the presence of sunlight the air temperatures are questionable if the wind speed is less than 1 m/s.

NOV 92

Table with 16 columns (HR, PP, TT, VV, DD) and 28 rows of hourly data for November 1992. The data is organized into 7 groups of 4 days each (DAY 1 to DAY 28), with each day having 6 hourly entries (HR 00, 03, 06, 09, 12, 15, 18, 21). Each entry consists of four values: PP (Pressure), TT (Temperature), VV (Winds), and DD (Missing observations).

5. AWS CALIBRATION

5.1. Temperature

The external and internal temperatures are calibrated using a 1000 ohm 0.05% resistor in place of the platinum resistance thermometers with 1000 ohms resistance at 0°C. Because the other resistances in the temperature circuit are known only to 1%, the temperature calibration will vary from one electronic unit to another. The correction factor determined from the calibration resistor is programmed into the read-only-memories for each unit. After the correction factors have been programmed into the AWS, a calibration box with 0.1% resistors is used in the field to check the temperature calibration.

5.2. Pressure

The atmospheric pressure transducer is a Parascientific model 215 digiquartz pressure gauge. The transducer frequency changes from 40 kHz at zero pressure to about 36 kHz at 1000 hPa. The pressure resolution is about 0.05 hPa.

Paulin aneroid barometers calibrated against a mercury barometer of 10 mm bore are used to check the pressure gauge calibration. Comparisons are made between AWS units, the aneroid barometer at McMurdo Station, and with the mercury barometers at Scott Base, Antarctica. The calibrations should be within +/- 0.2 hPa. Two mercury barometers have been purchased for use at McMurdo, Antarctica but are not yet available.

The reference vacuum on the older pressure transducers can degrade with time with a maximum observed 4 hPa shift to lower pressure after five years. Thus, recalibration of each pressure transducer would be desirable every two to three years.

5.3. Wind direction and Speed

The Belfort model 123 aerovane measures wind direction and speed. The aerovane rotates a potentiometer wiper and the fraction of full scale of the potentiometer is measured. The wind direction is checked by positioning the aerovane to the cardinal directions relative to the boom supporting the aerovane. North or the potentiometer zero is towards the antenna on the boom and has a dead zone of 5°. During the field installation the boom is usually aligned along the north-south line as determined from the sun's azimuth, longitude, and Greenwich Mean Time. In some cases the 180° end of the boom may point in a direction other than south. At the Manuela and Shristi sites, the 180° end of the boom points up the glacier and a correction is added to the data during processing. At Byrd site the wind is usually out of the north so the boom was rotated 120° and the correction added during the data processing. The wind speed is determined from the aerovane tachometer voltage output as 0.1056 volt per mile per hour. The aerovane tachometers are spun at 1800 rpm with a load of 1071.5 ohms and the output should be 9.20 +/- 0.05 vdc.

5.4. Relative Humidity

The Vaisala HMP-31UT or the slowly being replaced HMP-14UT humidity sensor output voltage varies linearly with relative humidity (U). The sensor calibration is done by placing the sensor over saturated salt solutions with known relative humidities at room temperature: sodium chloride (U=75%), and lithium chloride (U=12%) are used. In addition, a dry inert gas, forced past the sensor, gives a 0% U, and the sensor output can be zeroed. Then, the gain setting can be set directly using a salt solution with a high relative humidity, such as sodium chloride. The resolution of the humidity sensor is about 1% and the drift is 2 to 3% per year in the field. The relative humidity data are not included on the summary pages but are included in the disk files.

5.5. Vertical Air Temperature Difference

Two junction thermocouples are used to measure the air temperature difference between 3 m and 0.5 m on the tower. The output is about 78 microvolts for 1.°C temperature difference between the junctions at 0.0°C, dropping to 60 microvolts at -80°C. Zero output is adjusted to 0.4 volts, so that 0 to 1 volt corresponds to a -6°C to +9°C range of air temperature differences between 3 m and 0.5 m. The resolution is 0.05°C. Calibration of the individual systems is done by applying known voltages to the amplifier input. The vertical temperature difference data are not included on the summary pages but are included in the disk files.

6. AWS OPERATIONS SUMMARY FOR 1992

6.1. AWS Performance

Thirty six AWS units were installed at the start of 1992 and 35 were installed at the end of 1992. Based on the installation months the AWS units delivered 82% of the temperature data, 79% of the pressure data and 67% of the wind data during 1992. Complete data sets were received from 12 AWS units and 19 AWS units operated for the installed period. Fourteen AWS units were not received for one month or more during the year or stopped during the year.

The wind system has the poorest performance. If the wind speed is zero or the wind direction is constant for extended periods (days to months) then the data is considered invalid. The reason for this behavior is not known but is believed to be due to the build up of frost on the wind system. This usually occurs in the winter season and at several AWS sites. The wind speed is most frequently zero when the wind direction is constant. Another problem with the wind system that must be corrected involves the tachometer for measuring wind speed. The brushes quickly wear down and fill the gaps between the contacts with material shorting out the tachometer output. The result is we do not know the calibration. The problem is in the construction of the aerovane and the manufacturer does not respond to our request for a properly made wind system.

Site	Performance
D-10	Wind system did not operate from January through November
D-47	Unit did not transmit in July and August
Dome C	100%

Port Martin	Unit did not transmit in September through November
Cape Denison	Wind system did not operate from January through November, Data not received in June and August
Byrd Station	Not received in June.
Siple Station	Reception stopped in April
Mt. Siple	100%, Dog House, pressure and temperature only
Marble Point	100%
Ferrell	Not received in August
Pegasus North	100%
Pegasus South	Wind data lost for most of May, June, August, and September
Minna Bluff	100%
Linda	Not received after March
Willie Field	Wind data lost in May, June, August, and September
Whitlock	Stopped in January after operating continuously for 10 years
Young Island	100%, Dog House, pressure and temperature only
Marilyn	100%
Schwerdtfeger	Stopped in August after operating continuously for 6 years
Gill	Lost wind data for July and October
Lettau	Not received during August and September
Martha II	No wind data and unit was removed in February
Manuela	No wind data for March, April, and after September
Shristi	Not received January, February and after September
Sandra	Not received in June, July, and August
Sushila	Removed in January
Lynn	100%
Larsen Ice	Air temperature failed in January, February, and after July
Butler Is.	100%
Uranus Gl.	100%
Cape Adams	Not received after September, no wind data after April
Racer Rock	No wind data March through November
Bonaparte Point	100%
AGO Site	No wind data April through October
Clean Air	100%
Mt. Howe	July and October wind data missing, stopped after October

6.2. AWS Antarctic Field Activities

C.R. Stearns went on the U.S. Polar Sea on the Cruise to McMurdo, Antarctica. The intention was to install AWS dog house units at Scott and Possession Island. Due to high winds in the region this was not possible. At Terra Nova Bay the aerovane was replaced at Manuela site on 31 December 1991. The intention was to service Shristi site but overcast skies and snow flurries prevented the flight to Shristi site. We sailed for McMurdo, Antarctica.

At McMurdo, Antarctica the first order of business was installing an AWS unit at Mount Howe in support of a possible landing site. The boom at Clean Air site was tilted up so the boom was repositioned and secured. One solar panel was raised. An AWS unit was installed at Mount Howe on 11 January 1992. Linda site electronics and aerovane were replaced on 15 January 1992. On 16 January 1992 repairs were made to Minna Bluff AWS unit. Lynn site was raised five feet on 23 January 1992 and the aerovane and AWS electronics were replaced. Sushila site was removed on the return flight to McMurdo. The Willie Field AWS unit was installed on 25 January 1992.

Martha II AWS unit was removed by the Marine Science Technicians from the Polar Sea on 14 February 1992, and a dog house AWS unit was installed at Mount Siple on 20 February 1992. The AWS electronics at Racer Rock were replaced in November 1991 and the AWS unit was installed at Bonaparte Point in January 1992 by Tony Amos from the Polar Duke.

The British Antarctic Survey raise the Siple Station AWS five feet, reinstalled the Uranus Glacier AWS unit, replaced the aerovane at Butler Island, raised the Larson Ice Shelf Aws five feet and replaced the damaged aerovane at Larson Ice Shelf.

Expeditions Polaires Francaises replaced the wind system at Port Martin and replaced the AWS electronics at D-47 and at D-10.

7. GLOBAL TELECOMMUNICATIONS SYSTEM

The data from 29 Antarctic AWS units were entered into the Global Telecommunications System (GTS) during 1992. The World Meteorological Organization (WMO) headers are:

SMAA01 KNWC	ANTARCTICA
SIAA01 KNWC	ANTARCTICA.

Table 3.1 contains the WMO # used by the GTS grouped according to their purpose and proximity where possible.

The data for the GTS are collected by the Fleet Numerical Oceanography Center at Monterey, California by interrogating the ARGOS Timenet file at three or six hour intervals. The data are approximately two hours old at the time of interrogation and are used to generate synoptic maps. The data are also entered in the GTS at the Carswell Automated Digital Weather Switch for routing to the National Weather Service and other international centers. The main reason for getting the AWS data into the GTS is to make sure that the data are available in near real time for all organizations operating in Antarctica. Of all the meteorological data in the GTS received by the Australian Bureau of Meteorology at Hobart, Tasmania, the AWS units provided more surface meteorological data than all the manned stations.

8. DATA AVAILABILITY

The three hourly data are available on 5 1/4 inch diskettes at 360 KB and 1.2 MB and on 3.5 inch diskettes at 720KB and 1.44 MB, in IBM DOS format only. The three hourly data sets are also available in hardcopy. Data at 10 minute intervals along with the three hourly data are available by anonymous FTP. Please contact us for detailed instructions.

9. ACKNOWLEDGMENTS

This work is supported by the National Science Foundation, Office of Polar Programs, Grant 9303569 under the management of Dr. Bernhard Lettau of the National Science Foundation. Expeditions Polaires Francaises installs and maintains the AWS units along the Adelie Coast. The British Antarctic Survey maintains the AWS units on the east side of the Antarctic Peninsula and south of Adelaide Island.
