### AMPS Update – June 2017

Kevin W. Manning Jordan G. Powers

Mesoscale and Microscale Meteorology Laboratory National Center for Atmospheric Research Boulder, CO

12th Workshop on Antarctic Meteorology and Climate Boulder, CO: 26-28 June 2017

# Outline

- Review what is AMPS
- Highlights of what's new this past season
- Future

# The Antarctic Mesoscale PredictionAMPSSystem (AMPS)

- Real-time, experimental NWP system serving the needs of forecasters for the U.S. Antarctic Program
- Funded by NSF Office of Polar Programs
- Based on NCAR's Weather Research and Forecasting (WRF) model
  - Using adaptations from OSU/BPCRC Polar WRF
- Twice-daily forecasts since September 2000
- Real-time NWP graphics, text, and GRIB openly available through AMPS web page

#### THE WEATHER RESEARCH & FORECASTING MODEL

- Community model
  - Large and active community worldwide
  - Week-long summer and winter tutorials
  - Annual WRF Users' Workshop

- Regional focus
  - Short-term, high-resolution (1 -10 km grid spacing) simulations
  - Real-time forecasting (e.g., AMPS)
  - Longer-term, regional climate simulations
- Arctic/Antarctic adaptations
  - Taking advantage of OSU/BPCRC Polar WRF effort
  - Feeding back to WRF community as appropriate

#### **AMPS Grid Configuration**

- AMPS runs WRF with five two-way interactive nests
  - 30- and 10-km grids over all of Antarctica and environs
    - 3-hourly output to forecast hour 120
  - 3.3- and 1.1-km grids over areas of particular interest to USAP
    - Hourly output to forecast hour 39
- Two forecasts per day
  - 00Z and 12Z forecast cycles
- Grids initialized from NCEP GFS, with additional WRF Data Assimilation step
  - Hybrid Ensemble/3D-Variational Data Assimilation
  - 30-km lateral boundary conditions from GFS
- Ensemble on 30- and 10-km grids
  - Small ensemble: O(20 members)

12th Workshop on Antarctic Meteorology and Climate: 26-28 June 2017

# New this year!

12th Workshop on Antarctic Meteorology and Climate: 26-28 June 2017

## **Observations from BAS**

- Thanks to Steve Colwell (BAS)
- Steve noticed BAS sites missing from our GTS source (Unidata)
  - May need to get Unidata to extract surface BUFR obs?
- Steve created an FTP site for AMPS to pull real-time data from his catalogue of surface reports
- Testing this additional data in AMPS data assimilation resulted in a consistent reduction of forecast surface pressure bias
- Implemented September 2016
- Surface observations now drawn from three sources:
  - GTS (through Unidata)
  - AMRC (thanks to AMRC and AWS crews!)
  - BAS

# Field campaign support

- AMPS has traditionally supported various Antarctic field campaigns
  - Customized NWP products
    - As time and resources allow
    - As consistent with AMPS goals and mission

#### ACE

- Antarctic Circumnavigation Expedition
- Three-month circumnavigation of Antarctica
  - Wide variety of ecological, biological, climatological, meteorological, etc. investigations
- Ship-following AMPS graphics window

#### PIPERS

- Polynyas, Ice Production, and seasonal Evolution in the Ross Sea
- Two-month expedition of the Nathaniel B. Palmer to the wintertime Ross Sea
- Ship-following AMPS graphics window
- ROSETTA-ICE
  - Lamont-Doherty Earth Observatory study of Ross Ice Shelf
  - AMPS "truly valuable" in decision making to deploy autonomous ocean floats

# New computing platform

- Fifth generation of AMPS computing platforms
  - Box (90/30/[10]-km) (Sep 2000)
  - Pegasus (60/20/6.7/3.3-km) (Apr 2005) [dedicated]
  - Bluefire (45/15/5/1.7-km) (Oct 2008) [shared]
  - Erebus (30/10/3.3/1.1) (Jan 2013) [dedicated]
  - CHEYENNE (Jun 2017) [shared]

Slides and images courtesy of NCAR CISL

#### 4032 nodes

#### 145,152 cores -

- AMPS has dedicated highpriority queue on Cheyenne
- Approximately 2.5× computing power available to AMPS

12th Workshop on Antarctic Meteorology and Climate: 26-28 June 2017

- Higher resolution WRF runs
  - Testing 24/8/2.67/0.89 km grids
- Expanded ensemble
  - Test WRF physics options
  - Better hybrid Ensemble/3DVar data assimilation
- Better MPAS
  - Higher resolution 10km mesh over continent
  - Updated release (4.0  $\rightarrow$  5.1  $\rightarrow$  5.2)

#### 1.1-km grid

#### 0.89-km grid

#### 1.1-km grid

0.89-km grid

# **Coming Attractions!**

### WRF Version 3.9x

- Code update (currently AMPS uses WRFv3.7.1)
  Accumulated bug fixes and improvements
- New physics options
  - Predicted Particle Property (P<sup>3</sup>) microphysics might be interesting
- New ensemble options
  - Stochastically perturbed parameterization tendencies
    - Adds random perturbation patterns with spatial and temporal coherence to the physics tendencies
    - Promotes ensemble "dispersion", i.e., variation among members
- New "hybrid" vertical coordinate

#### Slides courtesy of Dave Gill

### Schar 2000 m, 20 km Z, 500 m dz, 1 km dx, W<sub>5h</sub> (m/s)

#### **Terrain Following**

#### **Hybrid Coordinate**

12th Workshop on Antarctic Meteorology and Climate: 26-28 June 2017

# Model for Prediction Across Scales

- MPAS not viewed as replacing WRF
  - In WRF community, or in AMPS
  - AMPS will likely be running WRF for the foreseeable future
    - MPAS runs with the high resolution in AMPS would be prohibitively expensive
- Why MPAS?
  - Global-to-regional mesh refinement greatly reduces lateral boundary and nest boundary interface problems
  - Regional MPAS available soon
  - Development shifting from WRF to MPAS
    - WRF will take advantage of MPAS development
      - E.g., hybrid vertical coordinate
      - "scale-aware" or "scale-insensitive" physics
    - WRF maintained for the long term
  - Model development (particularly physics) at NCAR to stress interoperability among models
    - Global perspective (including polar regions) necessary
  - Possible future WRF one-way nests driven from MPAS

# Thank You
